Physics Chapter 6: Waves

| Properties of waves | |
|----------------------|---|
| Two types of wave | Transverse or Longitudinal |
| Amplitude | The height of the wave crest or the depth of the wave trough from the |
| | position at rest |
| Wavelength | The distance from one point in the wave to the next identical point e.g crest |
| | to crest or compression to compression |
| Frequency | The number of wave crests passing a point in one second |
| Period | The time it takes to complete one wavelength |
| Speed | Frequency x wavelength |
| Hertz | Unit of frequency |
| Rarefaction | The area where the longitudinal wave is spread out |
| Oscillation of a | Is perpendicular to the direction of travel |
| transverse wave | |
| Oscillation of a | Parallel to the direction of travel |
| longitudinal wave is | |

| The Electromagnetic Spectrum | | |
|------------------------------|-----------------------|--|
| Electromagnetic waves | Transverse waves | |
| are all | | |
| Electromagnetic waves | at the speed of light | |
| all travel | | |

| Uses of waves | |
|-------------------|---|
| We use waves for | Transferring energy and information |
| Long wavelengths | heating effect and are used for communication. e.g radio waves and |
| have a | microwaves |
| Short wavelengths | ionising effect and are used for medical treatments, e.g X-rays and Gamma |
| have an | rays |

| Reflection | |
|-------------------------|--|
| The normal line | The point on a surface that is perpendicular to the mirror |
| The angle of incidence | The angle between the normal and the ray of incidence |
| The angle of reflection | Between the normal and ray of reflection |
| is the angle | |
| Ray of incident | Ray from the object going towards the mirror |
| Ray of reflection | Ray coming away from the mirror |

| Refraction | |
|------------------------|--|
| Refraction | e.g. is when a light ray when it crosses the boundary between two |
| | substances such as air and glass |
| Change in direction | Is caused by the change in speed of the waves passing from one material to |
| | the other |
| Speed is reduced (e.g. | Refracted ray goes closer to the normal |
| air to glass) | |
| Speed is increased | Refracted ray goes away from the normal |
| (e.g. glass to air) | |
| Explain colours in | Different colours of light have different wavelengths and are refracted by |
| refraction | slightly different amounts. |
| Violet light | Refracted the most |
| Red light | Refracted the least |
